

Web Access Management, Federated SSO & Externalized Authorization Management

Key Benefits

- Ease up integration and deployment efforts with native integration with existing LDAP, AD and JDBC directories, i.e. no schema changes or no information written to the external user stores
- Provide a highly scalable, open and reliable platform to support demanding operational requirements such as automatic failover, horizontal & vertical scaling and 24x7 operations
- Provide security management and enforcement of 4As, including authentication policies, authentication methods, user stores and administration delegation, as well as audit compliance reporting
- Lower integration and operational costs with a common set of IAM services for custom enterprise and internet applications to access

AccessMatrix™ Universal Access Management (UAM) is a comprehensive web single sign-on (SSO), web access management, federated single sign-on (SSO), externalized authorization management, and hierarchy-based delegated administration system. Leveraging on the AccessMatrix™ technology, UAM fulfills the most rigorous form of application security by providing secure Administration, Authentication, Authorization, and Audit services (4As) to business applications within your organization. Built on the regulatory requirements and standards in banking & finance sector, UAM enables custom enterprise / internet applications to access a common set of IAM (Identity & Access Management) services and lowers the integration cost.

UAM enables web-based applications for SSO offering the option of tightly integrated web access management approach. Alternatively, Cloud-based applications, especially in distributed locations, can adopt the loosely-coupled federated SSO approach based on standards like SAML 2.0.

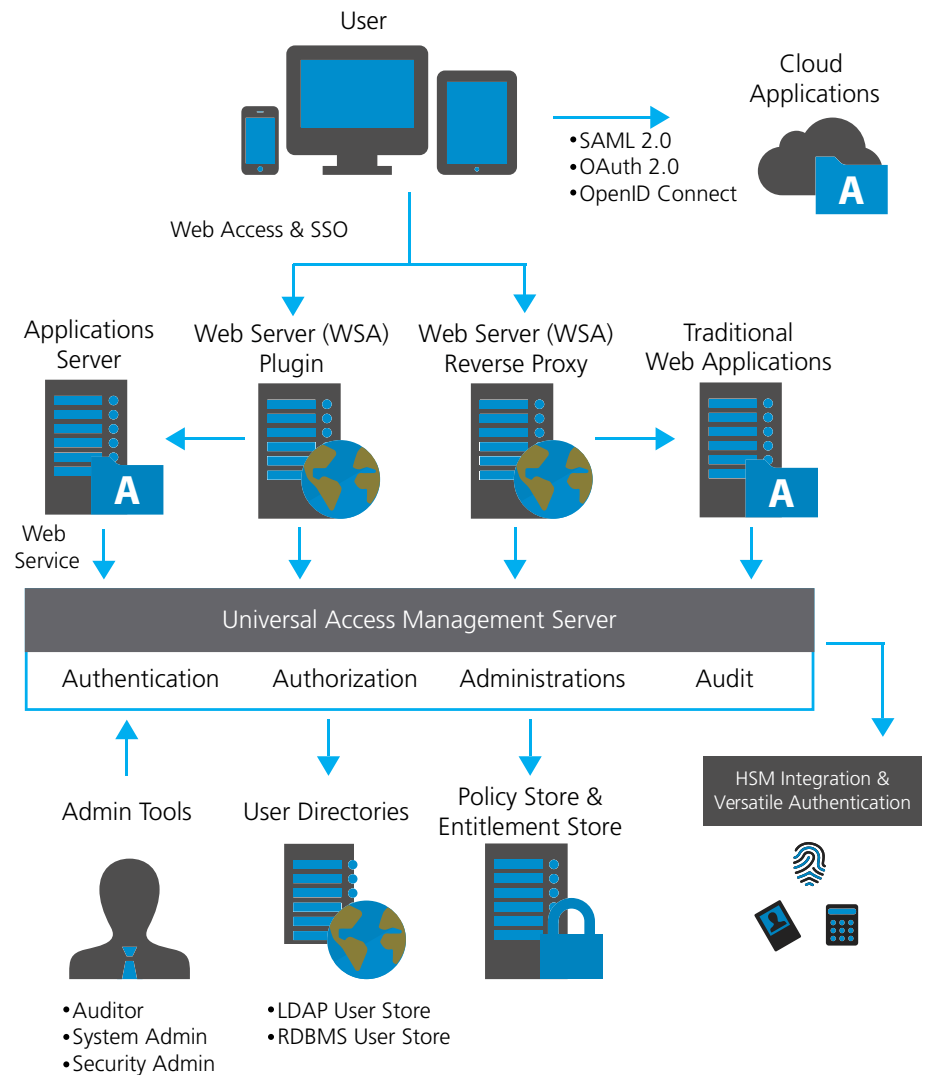

UAM is designed to secure multi-tier applications, either web-based or non-web-based, running in your own data center or within the Cloud. With use of Web Security Agents (WSA) to intercept web requests, UAM is able to protect web applications and application servers from threats identified by OWASP based on the centralized access control policy defined by the security administrators.

It increases productivity and reduces cost by relieving the business application developers from having to learn, design and implement complex security / audit / regulatory requirements.

With our patented Segmented Hierarchy-Based Security Administration and Authorization Framework, UAM has been proven to be well suited to address administration requirements for multi-region/department applications, corporate banking applications, Managed Security Providers and SaaS Providers.

Key Features

- Embedded Strong Authentication, Web SSO, Federated SSO and Enterprise SSO on the same backend
- Extensible Pluggable Authentication Modules support strong authentication requirements using SMS, hardware and software tokens
- Flexible and open APIs are provided for ease of integration and code re-use for security 4As services
- Support SAML, OAuth and OpenID Connect
- Tamper-evident Audit Trail
- Scalable

Application Integration

- Flexible and open APIs are provided for ease of integration and code re-use for security 4As services. UAM APIs support a wide variety of programming languages with web services, Java and .NET interfaces.
- Web Security Agent Plugins for all leading web and application servers enable UAM to support URL level access control for web applications with ability to transparently push user information via standard HTTP request headers to assist your web applications in establishing the user identities and aggregate information from multiple directories.
- Native Integration with External User Stores, such as LDAP and Active Directory as external User Stores via LDAP protocol or JDBC, enable organizations using their existing user registries without the need to synchronize user information. UAM server can access the external user store(s) directory to simplify the integration efforts.

Scalability

Design for Reliability and Scalability, UAM leverages commercial grade java application servers such as IBM Websphere, Oracle WebLogic to support high availability, horizontal & vertical scaling and 24x7 operations. UAM supports scalable, non-blocking operations through its Event Listener SDK or established Queuing Mechanism like IBM MQ. UAM has production sites with up to 10 million accounts.

Authentication

- Flexible Password Policies and Quality Checks are supported by the built-in proprietary static passwords and LDAP authentication module. Enhanced end-to-end encrypted passwords with HSMs are also supported.
- Extensible Pluggable Authentication Modules support strong authentication requirements using SMS, hardware and software tokens. Some of the token vendors include Vasco, Gemalto, SafeNet, OATH, etc.

Externalized Authorization

- Built-in Role-Based Access Control (RBAC) model grants applications specific roles to both users and groups. Upon successful authentication, user role information can be passed to applications transparently via HTTP header or via web service integration.
- User Authorization Mapping of user IDs in different applications to a unique SSO IDs is useful for co-existence strategy when existing applications wish to migrate to the UAM SSO system. Such user information can again be transparently passed to applications protected by WSA or via web service integration.

Administration

- Delegation & Administrative Scope can be defined by the web-based Admin Console. Security administration functions can be restricted to an OU / segment within a particular user store e.g. Active Directory. Administrative rights can be delegated from root administrators to another administrator down the reporting hierarchy to decentralize administration and ensure a high level of accountability. The framework can be extended to allow external organizations to manage IDs and user rights by their own security administrators with a custom admin interface.
- Best Security Practices such as key management with established HSMs (Hardware Security Modules) from SafeNet and Thales adopted enable UAM to enforce principles like dual control workflow, least privilege and segregation of duties effective for change of security policies and other critical operations via our admin console.

Audit

- Tamper Evident Audit Trail addresses administration, access and transaction audit requirements. Other than the standard audit trail logging, UAM audit APIs can be used to generate application specific audit trail information.
- Ready Module for Audit Reports offer a standard set of user-centric reporting capabilities to both administration and access activities. Reports can be easily customized via SQL views with Jasper.

System Requirements

- Server OS: MS Windows Server 2008, IBM AIX, Oracle Linux & Oracle Solaris
- Application Server: Oracle WebLogic, IBM WebSphere and Apache Tomcat
- Java Runtime: JRE 1.6 and above
- Database for Policy Store: MS SQL Server, Oracle RDBMS, IBM DB2 and Oracle MySQL
- External User Store: Active Directory, LDAP v3 compliant directories and JDBC compatible databases
- FIPS Certified HSM

About i-Sprint Innovations

i-Sprint Innovations is the premier Identity, Credential and Access Management Solutions provider for global financial institutions and high security sensitive environments. i-Sprint maintains the highest value and reliability rankings among its clients, and is one of the most recognized names in the financial world.

i-Sprint was incorporated in Year 2000, when the company first established an office in Singapore. Singapore, being one of Asia's Top Tech cities with stable, clean and efficient government that supports a strong infocomm infrastructure and security policies, presents boundless opportunities and growth for i-Sprint. With Headquarters in Singapore, i-Sprint has expanded rapidly across Asia Pacific. We now have direct presence and active authorized partners across China (Beijing, Shanghai, GuangZhou, ShenZhen, Chengdu, Zhuhai), Hong Kong, Taiwan, Malaysia, Thailand, Japan, and the United States.

i-Sprint's Products and Solutions

i-Sprint's own unique brand of security products, intellectual properties and patents are designed to exceed global financial services regulatory requirements. In order to capitalize the fast growing Identity, Credential and Access Management (ICAM) market, i-Sprint proactively delivers innovative product features via our product offerings in **Identity Protection, Cloud Protection, Mobile Protection** and **Data Protection**.

Our world leading security solutions include a proven and secure E2E Encryption (E2EE) Authentication and Data Protection for convenient (Single Sign-On) and secure access to internet banking applications. Our solution meets Internet Banking Security Guidelines from regulatory agencies in multiple countries; overcoming the security challenges of most internet and mobile banking solutions. We deliver bank-grade versatile strong authentication (biometrics, multi-factor authentication and more) and token management platform to secure multiple application delivery environments (web, mobile and cloud) based on a common security platform.
