

Identity & Access Management Solutions

i-Sprint™ Innovations specializes in Identity and Access Management Solutions for global financial institutions and high security sensitive environments. We deliver a suite of integrated enterprise-class solutions to enable our clients to centralize administration, authorization, authentication, single sign-on and provide audit trails of access to their business applications. Our solutions provide a consistent technology approach to enforcing corporate security policy and managing governance, risk and compliance processes.

Our unique Security Consolidation methodology, helps organizations of all sizes to address their IAM needs by using an incremental, evolutionary and strategic approach based on a common security infrastructure philosophy. Our Client list includes leading global and regional financial institutions, MNCs and government agencies. i-Sprint provides a suite of proven security solutions built upon security centric architecture that allows our client to benefit from the inherent advantages of such an approach to security.

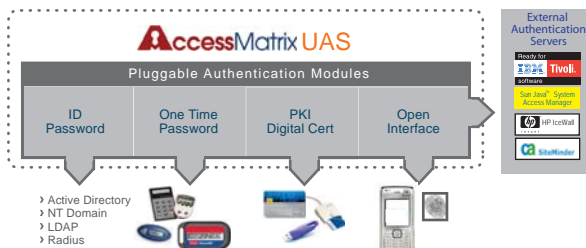

i-Sprint's bank-grade products, currently includes AccessMatrix™ Universal Authentication Server, AccessMatrix™ Universal Sign-On™, AccessMatrix™ Universal Access Management AccessMatrix™ SDK and Enterprise AdminGuard™.

AccessMatrix UAS

Future Proof Universal Authentication Server

AccessMatrix™ Universal Authentication Server (UAS) enables organizations to deploy a wide variety of authentication methods to address the business requirements for strong authentication and evolving authentication mechanisms, through a single, unified framework. AccessMatrix UAS is a future-proof authentication infrastructure. It supports multiple authentication mechanisms for strong authentication and authorization requirements. UAS enables organizations to rapidly deploy a wide selection of authentication methods to address their authentication requirements. Based on the proven AccessMatrix Integrated Security Architecture, UAS provides security Administration, Authentication, Authorization, and Audit services (4As) for business applications.

Supports for multiple authentication methods such as Ids/Passwords, dynamic passwords, certificates, biometrics, or security tokens is achieved through a simple Pluggable Authentication Module (PAM) approach. The selection of the authentication methods can be done without changing the source code of the application. Benefits include reduced cost, time to market and minimal effort for customization or "hardcode" of the application. With AccessMatrix UAS, multiple web applications and network devices allow access to a common set of security services via tight integration with the AccessMatrix security server.

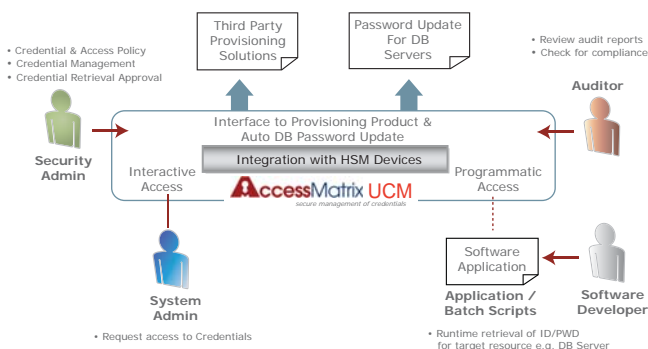

AccessMatrix UCM

secure management of credentials

AccessMatrix UCM provides a virtual safe deposit box with strong encryption using HSM devices to store confidential information. UCM provides the features to both Interactive Access and Programmatic Access via applications or batch scripts.

Interactive Access provides a secure approach to enable security administrators to manage and deposit credentials into the UCM solution. This is to enable authorized users to check in and check out privileged credentials to perform their duties or during emergency situations. **Programmatic Access** is to provide a proven approach to avoid hard coding of

privileged IDs and Passwords inside applications and batch scripts. All credential information is retrieved at execution time. Based on the security policy, UCM can also be configured to perform automatic password update to database servers

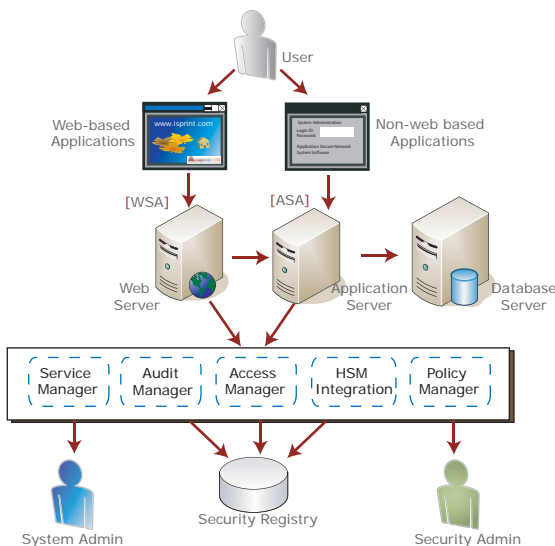

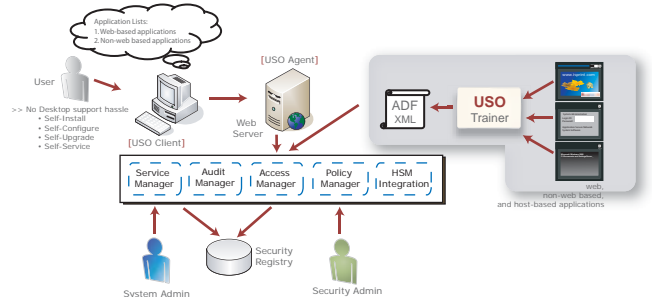

- ▶ The UCM solution can be integrated with other provisioning solution to provision the password information to the targeted platforms.
- ▶ If the targeted platforms are database servers such as IBM DB2, Microsoft SQL Server, Oracle RDBMS or other JDBC compliant databases, UCM also provides an optional module to reset the passwords for the privileged users.

AccessMatrix USO

non-intrusive single sign-on approach

AccessMatrix™ Universal Sign-On (USO) is a non intrusive enterprise single sign-on solution. The need to remember too many IDs and passwords that change frequently inconveniences users and creates a security risk. By deploying USO, our clients have improved staff and customer satisfaction, resulting in higher productivity and reduced administration costs, plus enhancing security.

Client/server, host-based, Java-based and web-based applications are supported without source code changes. Unlike other single sign-on products, manual client software installations are not required on the user's desktops.

AccessMatrix UAM

common security platform for enterprise applications

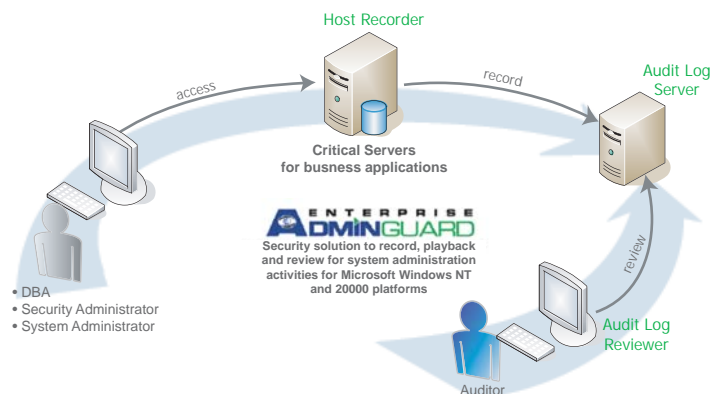

AccessMatrix™ Universal Access Management (UAM) is a proven enterprise-class application access control, single sign-on and security administration system. It controls and manages user access to all enterprise applications. Leveraging on the AccessMatrix technology, UAM fulfils the most rigorous form of application security by providing security administration, authentication, authorization, and audit services (4As) to business applications within your organization. Multiple applications can benefit from a common set of security services through tight integration with our AccessMatrix security server.

ENTERPRISE ADMINGUARD

capturing key strokes, mouse actions and screen activities

i-Sprint's Enterprise AdminGuard™ is a secure means of capturing and reviewing system administration activities. This unique product empowers organizations to secure multiple Windows servers from the potential misuse of administrators or to assist in the recovery of operational errors.

Intentional or accidental errors such as the deletion of files, modifications of databases, reformatting of hard disks cause business disruptions and loss of customer confidence. Enterprise AdminGuard™ ensures accountability among system administrators, operators and database administrators by recording every mouse click, keystrokes and providing complete session-based audit files.
